Gripnail Machinery

Safety

- The Gripnail #211 Air Tool features a safety interlock to prevent fasteneres from be accidentally projected from the tool. The fastener and driver must be depressed firmly against the work surface in order for the driver to contact th piston. The tool may be acitvated if the driver is not depressed, but the fastener will not be projected.
- To ensure safe and trouble-free operation of your Air Tool, read all instructions before assembly. Also, follow instruction in the order they appear in this instruction sheet.
- WARNING: OPERATORS MUST WEAR SAFETY GLASSES OR GOGGLES AND HEARING PROTECTION WHEN OPERATING THIS TOOL.
 NOISE DURING INSTALLATION OF THE METALTACK MAY EXCEED 100dB. (Operators should wear company standard Personal Protection Equipment)
- Operating pressure must not exceed 100PSI (7kg/sg cm).
- Always disconnect the air supply before servicing, when removing the Driver, or when the tool is not in use.
- Check regularly to be certain the Driver moves freely and does not stick or bind in the extended or cocked position during operation. (See "Troubleshooting" section)
- Do not connect a female quick coupler to the tool; attach a male free flow nipple to the tool for the Freedom Swivel® and a female quick coupler to the supply hose. An improper connection will cause the tool to remain charged after it is disconnected, allowing it to be fired if the trigger is activated.
- Do not, under any circumstance, fire the tool with the Driver in the cocked position without driving a fastener
- Keep hands and face away from the area being fastened.
- Do not use oxygen or combustible gas as a power source for this tool. FAILURE TO OBSERVE ANY OF THESE WARNINGS MAY RESULT IN INJURY.

What you need

211 Air Tool

Freedom Swivel Air Coupler

Air Regulator with Gauge

Driver

Industrial Fasteners

Prepare the tool

Unscrew the nose piece and slide the blunt end of the driver into the tool. Reassemble and tighten the nose piece.

Start with 50PSI for fastening to aluminum, 60PSI for fastening to steel and 70PSI for cast iron. Raise PSI as needed.

Place the fastener on the end of a Driver

Apply the fasteners

Carefully position the tool perpendicular to the work surface and guide the industrial fastener into the center of the attachment hole. Use a magnet or tape to temporarily hold the nameplate during fastening.

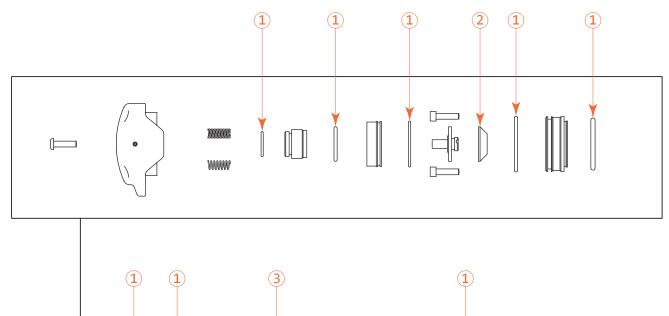

Depress the drive into the tool, then activate the trigger. (Always use both hands to hold the tool firmly in place.)

Do not lean on the tool with one hand.

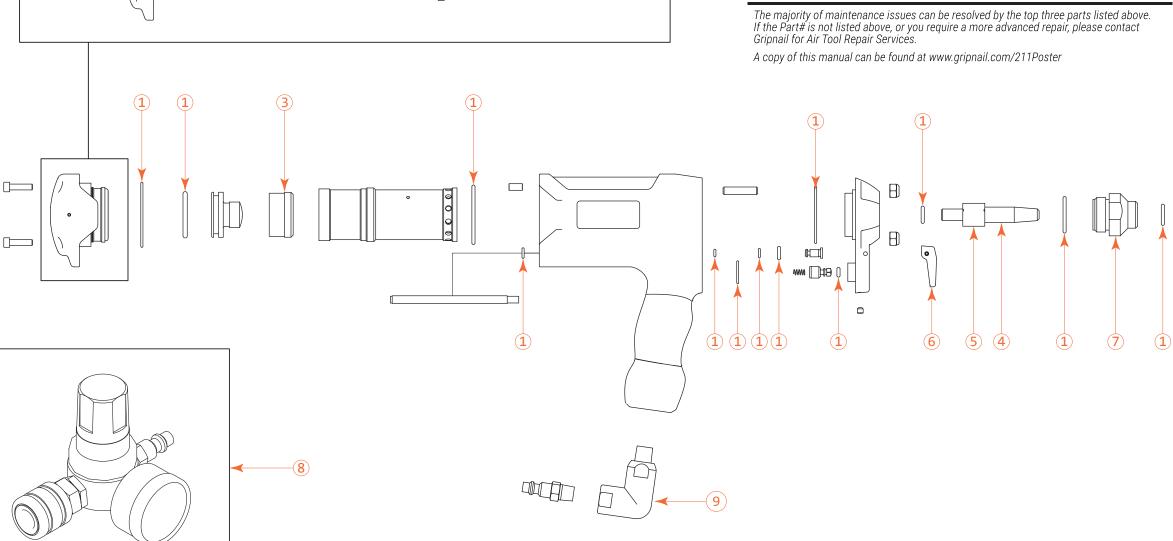

This will cause the tool to "jump" forward and lead to poor results.

Replacement Parts

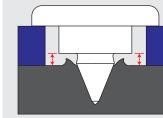

Common Air Tool Repair Parts

Item No.	Part No.	Description
1	20514	O-Ring Kit (For #211)
2	30322	Exhaust Seal
3	30314	Piston Bumper
4	Inscribed on Part	Driver (Retainer Included)
5	30331	Driver Retainer
6	42579	Trigger
7	30328	Driver Nose Tip
8	20380	Air Regulator with Gauge
Ω	47001	Freedom Swivel™

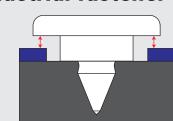

The correct industrial fastener

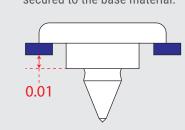

Grip length too shortThe locking groove will not fill the base material.

Just RightThe attachment is secure and the locking groove is filled.

Grip length too longThe attachment will not be secured to the base material.

Quick Check

Position a fastener through the hole in the attachment. You should see up to 0.01" (0.254mm) of the shank beyond the attachment surface

Air Pressure

If the attachment is loose - make certain that you have the right fastener and then increase the air pressure in increments of 5PSI until the attachment is tight.

If the fastener is damaging the attachment - decrease the air pressure in increments of 5PSI until the attachment is secured but not damaged.

If the fastener does not hold - make certain that you have the right fastener and then contact Gripnail at 401-216-7900 or gripnail@gripnail.com

Maintenance

Lubricate - A filter-regulator-lubricator unit should be installed within 20 feet of the tool.

Use S.A.E. #10 non detergent oil

<u>Driver Magnetism</u> - If the driver no longer holds the fastener, check for driver wear. The tip of the magnetic driver will eventually become worn and will need to be replace.

(Call Gripnail and ask about the free Driver re-magnification program to restore holding power to older drivers)

Troubleshooting

Air Tool "Jumps" - If the fastener misses the target, try holding the tool more firmly and making sure it is exactly perpendicular to the working surface and the tool is depressed from the back (as depicted in the "Apply the Fastener" section). Also, make certain that the base material is solidly supported. This is particularly important when fastening to curved surface.

Low Air Tool Impact - If the Air Tool impact decreases, first check the air pressure, then look for the following worn or broken parts:

Check for driver binding

Make certain that the driver slides back and forth freely in the nose piece. If the driver is not lubricated or binds it will decrease the tools impact.

Check for a cracked Driver Retainer

This part will fail if the tool is repeatedly "dry" fired, the PSI is too high, or no regulator is used while installing a fastener. Never alter the retainer. Replace it when needed.
